

MORE LOAD, MORE REPS = MORE MUSCLE.....right?

Myth Busting the Repetition and Load Continuum in Strength and Conditioning

Don't more reps = more muscle mass?

- All rep ranges produce muscle mass increases (Jenkins et al. Klemp et al. Schoenfeld et al)

But what about strength gains?

- Strength is more productive at higher loads, but levels out when training close to task failure (Jenkins et al. Klemp et al. Lascevicus et al. Schoenfeld et al)

Does endurance get better with more reps?

- Yes, high reps can produce more endurance gains compared to low reps (Klemp et al. Schoenfeld et al)

Does training to failure help?

- Training to technical failure is helpful for low loads but makes no difference in high load training (Lascevicus et al)

What does the science say?

Conclusion...

- Muscle mass can be gained at **ALL** rep ranges!
- Strength can be built at **ALL** loads when taken close to task failure!
- Endurance is **BEST** programmed for low load, high reps.
- Training to failure can help at low loads but not necessary for high load training....be mindful of **RECOVERY** timelines!

When in doubt talk to your strength coach....we are here to help!
